A Compelling Case for Intelligent Design Based on Revolutionary Discoveries in Science

In Signature in the Cell, Stephen Meyer has written the first comprehensive DNA-based argument for intelligent design. As he tells the story of successive attempts to unravel a mystery that Charles Darwin did not address—how did life begin?—Meyer develops the case for this often-misunderstood theory using the same scientific method that Darwin himself pioneered. Offering a fresh perspective on one of the enduring

mysteries of modern biology, Meyer convincingly reveals that the argument for intelligent design is not based on ignorance or "giving up on science," but instead on compelling, and mounting, scientific evidence.

About the Author

Dr. Stephen C. Meyer received his PhD from the University of Cambridge in the philosophy of science. A former geophysicist and college professor, he now directs the Center for Science and Culture at the Discovery Institute in Seattle. In 2004, Meyer ignited a firestorm of media and scientific controversy when a biology journal at the Smithsonian Institution published his peer-reviewed scientific article advancing intelligent design. Meyer has been featured on national television and radio programs, including The NewsHour with Jim Lehrer, CBS' Sunday Morning, NBC's Nightly News, ABC's World News, Good Morning America, Nightline, FOX News Live, and the Tavis Smiley show on PBS. He has also been featured in two New York Times front-page stories and has garnered attention in other top national media.

Derek Shetterly has worked extensively as an on-air radio talent, voice-over actor, and audiobook narrator. A graduate of Southern Illinois University at Carbondale with a BA in radio and television, he lives in Oregon.

SIGNATURE IN THE CELL: DNA AND THE EVIDENCE FOR INTELLIGENT DESIGN BY STEPHEN C. MEYER PDF

[Read by Derek Shetterly]

Named one of the top books of 2009 by the Times Literary Supplement (London), this controversial and compelling audiobook from Dr. Stephen C. Meyer presents a convincing new case for intelligent design (ID) based on revolutionary discoveries in science and DNA. Along the way, Meyer argues that Charles Darwin's theory of evolution as expounded in *The Origin of Species* did not, in fact, refute ID. If you enjoyed Francis Collins's *The Language of God*, you'll find much to ponder -- about evolution, DNA, and intelligent design -- in *Signature in the Cell*.

Can it refute intelligent design (ID)? In *Signature in the Cell*, Stephen Meyer argues that he did not.

Much confusion surrounds the theory of intelligent design. Frequently misrepresented by the media, politicians, and local school boards, intelligent design can be defended on purely scientific grounds in accordance with the same rigorous methods that apply to every proposed origin-of-life theory.

Signature in the Cell is the first book to make a comprehensive case for intelligent design based upon DNA. Meyer embarks on an odyssey of discovery as he investigates current evolutionary theories and the evidence that ultimately led him to affirm intelligent design.

Clearly defining what ID is and is not, Meyer shows that the argument for intelligent design is not based on ignorance or "giving up on science," but instead upon our growing scientific knowledge of the information stored in the cell.

A leading proponent of intelligent design in the scientific community, Meyer presents a compelling case that will generate heated debate, command attention, and find new adherents from leading scientists around the world.

I've read it twice

By M. Spiller

I'm not a Christian and I certainly don't believe in "creation science" which is often confused with intelligent design. I have spent my life studying science, and all of my degrees are in scientific and medical areas, but I've always been interested in spirituality. It's unfortunate that so many scientists are atheists. Perhaps they have no choice in the matter since they are generally wed to the very narrow perspectives of their scientific specialties. (Others, like Richard Dawkins, are wed to the industry of Atheism.) The Signature in the Cell was the first book that I have read that explains in no uncertain terms why the genetic code would be impossible for nature to create by randomly combining primordial molecules. It is a technical book filled with technical facts and statistics that is so interesting that you forget that you are actually learning something. Although it doesn't talk about God or any form of religion or spiritual world, it is difficult to avoid the obvious conclusion that something outside of our material universe had something to do with the very first reproducing organism as well as multiple steps along the way to the evolution of the human species. (Myer himself does not draw any inferences about anything outside of the material universe. He simply draws the conclusion that an intelligent designer is the simplest, and for all practical purposes, the only explanation for the rise of life from a lifeless world.)

If you have studied quantum mechanics, you will have run into the inescapable conclusion that nothing really exists in a determinate state unless it is observed by a conscious observer. Furthermore, you probably have run into Bell's theorem which concludes that locality is something of a myth and that there is no logical connection between the reality we live in every day and quantum reality upon which our material world is based. The theory of quantum mechanics frankly states that consciousness is (and probably was) a primordial property of the universe.

The theory of intelligent design is based upon SCIENCE, and not on theology. It stands upon infinitely firmer ground than the Multiverse which is modern cosmology's latest mathematical/theological attempt to explain the anthropomorphic nature of our world of matter. Read this book if you really want to begin the journey to a rational understanding of how Spirit might actually have a place to live after all!

P.S. I've read the one star reviews. It is obvious that none of these reviewers has actually read the book. Out of 429 reviews, only 58 gave it two stars or less, and their comments seemed to have nothing to do with the book's actual content.

Addresses Far More Objections Than I Anticipated; More Careful Than Proto-ID Theorists; Need to Read Before Judging

By Amazon Consumer

I read this being a bit skeptical about the movement etc., alongside his other book and Collins' "Language of God," but found it to address all of the objections typically lodged against the concepts (the predictive experimental power of ID is particularly intriguing), and if nothing else, a very well-written, self-critical piece of work. It really amazed me just how much critics and onlookers confuse with "ID"; they tend to think the title (which is somewhat lousy, contrary to what some think) explains what they think it does, and it simply does not. Meyer is also far more careful with words and arguments than Dembski and the earlier ID crew, and should not be conflated as merely touting the same ideologies. At least that appears to be the case.

To zoom out for a moment, the unspoken rule that Meyer breaks is not simply critiquing Neo-Darwinism or uncovering materialistic naturalism, but showing that the disciplines are not as fixed and compartmentalized as Modern education would have it to be. That's the "game changer" in my opinion; can intelligence (of any kind) be "scientifically detectable"? He says, yes, while others either say "no" (BioLogos) or "we shouldn't try to answer that" (academy). Modern epistemology is being questioned as much as atheistic materialism, and for that reason alone the specialists cannot continue pretending as if knowledge is unrelated and easily

crosses boundaries, and have to deal with what is presented here.

Simply Amazing

By Jimm Been

Stephen Meyer has out done himself. This book should be required read for those who are exploring the evolutionary study. Intelligent Design study needs to be given more attention to. Recommend this book for everyone.
